# CSC236 Week 05: Languages: Definitions

#### Hisbaan Noorani

#### October 7 – October 13, 2021

#### Contents

1	Some definitions	1
2	More notation — string operations	2
3	Language operations	2
4	Another way to define languages	2
5	Regular expression to languages:	3
6	Regexp examples	3

#### 1 Some definitions

- alphabet: Finite, non-empty set of symbols, e.g.  $\{a,b\}$  or  $\{0,1,-1\}$ . Conventionally denotes  $\Sigma$ .
- string: Finite (including empty) sequence of symbols over an alphabet: abba is a string over  $\{a,b\}$ . Convention:  $\varepsilon$  is the empty string, never an allowed symbol,  $\Sigma^*$  is set of all strings over  $\Sigma$ .
- language: Subset of  $\Sigma^*$  for some alphabet  $\Sigma$ . Possible empty, possibly empty, possibly infinite subset. E.e.  $\{\}, \{aa, aaa, aaaa, \dots\}$ .

**N.B.:** 
$$\{\} \neq \{\varepsilon\}. \ |\{\}| = 0 \neq 1 = |\{\varepsilon\}|$$

Many problems can be reduced to languages: logical formulas, identifiers fro compilation, natural language processing. Key question is recognition:

Given language L ans string s, is  $s \in L$ ?

### 2 More notation — string operations

- string length: denotes |s|, is the number of symbols in s, e.g. |bba| = 3.
- s = t: if and only if |s| = |t|, and  $s_i = s_t$ , for  $0 \le i < |s|$ .
- $s^R$ : reversal of s is obtained by reversing symbols of s, e.g.  $1011^R = 1101$ .
- st or  $s \circ t$ : concatenation of s and t all characters of s followed by all those of t, e.g.  $bba \circ bb = bbabb$ .
- $s^k$ : denotes s concatenated with itself k times, e.g.  $ab^3 = ababab, 101^0 = \varepsilon$ .
- $\Sigma^n$ : all strings of length n over  $\Sigma$ ,  $\Sigma^*$  denotes all strings over  $\Sigma$ .

## 3 Language operations

- $\overline{L}$ : Complement of L, i.e.  $\Sigma^* L$ . If L is a language of strings over  $\{0,1\}$  that start with 0, then  $\overline{L}$  is the language of strings that begin with 1 plus the empty string.
- $L \cup L'$ : Union.
- $L \cap L'$ : Intersection.
- L L': Difference.
- $\operatorname{Rev}(L)$ :  $= \{s^R : s \in L\}$
- concatenation: LL' or  $L \circ L' = \{rt : r \in L, r \in L'\}$ . Special cases  $L\{\varepsilon\} = L = \{\varepsilon\}L$ , and  $L\{\} = \{\} = \{\} L$ .
- exponentiation:  $L^k$  is concatenation of L, k times. Special case,  $L^0 = \{\varepsilon\}$ , including  $L = \{\}$ .
- Kleene star:  $L^* = L^0 \cup L^1 \cup L^2 \cup \dots$

### 4 Another way to define languages

In addition to the set description  $L = {\dots}$ .

Definition: The regular expressions (regexps or REs) over alphabet  $\Sigma$  is the smallest set such that

- $\emptyset, \varepsilon$ , and x, for every  $x \in \Sigma$  are REs over  $\Sigma$ .
- If T and S are REs are over  $\Sigma$ , then so are:
  - -(T+S) (union) lowest precedence operator
  - (TS) (concatenation) middle precedence operator
  - $-T^*$  (star) highest precedence

### 5 Regular expression to languages:

The L(R), the language denoted (or described) by R is defined by structural induction.

- Basis; If R is a regular expression by the basis of the definition of regular expressions, then define L(R):
  - $-L(\emptyset) = \emptyset$  (the empty language no strings!)
  - $-L(\varepsilon) = \{\varepsilon\}$  (the language consisting of just the empty string)
  - $-L(x) = \{x\}$  (the language consisting of the one-symbol string)
- Induction step: If R is a regular expression by the induction step of the definition, then define L(R):

$$-L((T+S)) = L(S) \cup L(T)$$

$$-L((TS)) = L(S)L(T)$$

$$-L(T^*) = L(T)*$$

We are assuming about (S+T) and (ST) above?

### 6 Regexp examples

- $L(0+1) = L(0) \cup L(1) = \{0,1\}$
- $L((0+1)^*)$  All binary strings over  $\{0,1\}$
- $L((01)^*) = \{\varepsilon, 01, 0101, 010101, \dots\}$
- $L(0^*1^*)$  0 or more 0s followed by 0 or more 1s
- $L(0^* + 1^*)$  0 or more 0s or 0 or more 1s
- $L((0+1)(0+1)^*)$  Non-empty binary strings over  $\{0,1\}$
